

FACLON LABS I/O VISION

Conveyor Failures Start Small. Catch Them Before They Stop Production.

Misalignment, wear and jams leave visible signs hours or days before a breakdown. Faclon Labs I/O Vision continuously monitors your conveyors to detect these early signs and help your team act before production is affected.

- Belt Conveyors
- Tray Conveyors
- Shuttle Conveyors
- Pipe Conveyors
- Foreign Objects

01 THE PROBLEM

Small Conveyor Issues Can Become Big Production Problems

Conveyors run long, fast and often enclosed. Manual rounds can't keep pace.

-  Belt misalignment, slippage and tears develop between inspections
-  Tray jams and overlaps disrupt flow during high-speed operation
-  Shuttle proximity sensors fail under dust and material buildup, causing wrong dispensing and overflows
-  Pipe conveyor belts stay folded, so seam separation and tears go unseen until spillage occurs

The result: unplanned stoppages, material loss and reactive maintenance.

02 THE SOLUTION

Continuous Visibility Across Every Conveyor

AI-powered cameras that watch every metre of your conveyor, every minute of every shift.

Faclon Labs combines industrial cameras with Vision AI to continuously monitor conveyor conditions, detect anomalies in real time and help maintenance teams act before faults escalate.

MONITOR

 **Belt Conveyors**
Misalignment, slippage, wear and tears

 **Tray Conveyors**
Jams, overlaps and tray deformation

 **Shuttle Conveyors**
Position tracking and dispensing accuracy

 **Pipe Conveyors**
Pipe opening, seam separation, belt twist and idler issues

 **Foreign Objects**
Tools, debris and unwanted material on the belt

Connect detections with SCADA, PLC and CMMS to turn visual events into actionable maintenance workflows.

SCADA → PLC → CMMS

03 THE IMPACT

From Reactive Maintenance to Planned Action

Early detection helps teams intervene before a conveyor fault becomes a production stoppage.

-  **Less Unplanned Downtime**
Identify developing faults before they escalate
-  **Longer Equipment Life**
Address wear before it becomes major damage
-  **Consistent Material Flow**
Detect jams and interruptions in real time
-  **Better Maintenance Planning**
Prioritise work based on actual equipment condition
-  **Safer, Cleaner Operations**
Detect foreign objects before they cause damage or contamination

See the problem earlier. Act before production stops.

04 FROM VISION TO ACTION

Know What's Failing. Where It's Happening. What to Fix First.

Faclon turns continuous visual monitoring into actionable intelligence.

-  **Belt Health Scores**
Prioritise repairs based on actual condition.
-  **Defect Hotspot Mapping**
Identify recurring problem areas across the conveyor.
-  **Automated Maintenance Workflows**
Turn detections into inspection and maintenance tasks.
-  **Material Traceability**
Connect conveyor events with trays, batches and affected material.

05 PROVEN IN INDUSTRIAL OPERATIONS

Built for Real-World Conveyor Conditions

Deployed across multiple conveyor types at a leading Indian metals producer.

Belt Tray Shuttle Pipe
